

BUILD CHAT — FIRST-PROOF

Ana María Matas

Week 9 Business Bending

Product: First-Proof

User:

Inspect this repository and tell me:

1. what files currently exist,
2. whether git is initialized,
3. whether this folder already contains a Next.js project,
4. what you recommend as the safest first setup step.

Do not create or modify anything yet.

Codex:

I'll perform a read-only inspection of the directory, Git metadata, and common Next.js project markers. I won't modify anything.

Codex:

TOOL CALL — EXEC

```
const r = await tools.exec_command({
  cmd: "pwd && rg --files -uu -g '!node_modules' -g '!git/objects/**' -g '!git/logs/**' | sort && git
rev-parse --is-inside-work-tree && git status --short --branch && find . -maxdepth 2 -type f \\( -name
package.json -o -name next.config.js -o -name next.config.mjs -o -name next.config.ts -o -name pnpm-
lock.yaml -o -name yarn.lock -o -name package-lock.json -o -name bun.lock -o -name bun.lockb \\) -print",
  workdir: "/Users/anamatatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business",
  yield_time_ms: 10000,
  max_output_tokens: 20000
});
text(r.output);
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.8 seconds
Output:
/Users/anamatatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business
.DS_Store
PACKET_AnaMariaMatas_Week9.pdf
docs/PACKET.md
docs/PACKET.pdf
fatal: not a git repository (or any of the parent directories): .git
```

Codex:

The folder has four visible files and Git reports that it is not a repository. I'm doing one final read-only check for empty directories and nested project manifests before recommending the first step.

Codex:

TOOL CALL — EXEC

```
const r = await tools.exec_command({
  cmd: "find . -maxdepth 3 -print | sort\nfind . -maxdepth 4 -type f \\( -name 'package.json' -o -name 'next.config.js' -o -name 'next.config.mjs' -o -name 'next.config.ts' -o -name 'tsconfig.json' -o -name 'jsconfig.json' -o -name 'pnpm-lock.yaml' -o -name 'yarn.lock' -o -name 'package-lock.json' -o -name 'bun.lock' -o -name 'bun.lockb' \\) -print",
  workdir: "/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business",
  yield_time_ms: 10000,
  max_output_tokens: 20000
});
text(r.output);
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.1 seconds
Output:
.
./.DS_Store
./PACKET_AnaMariaMatas_Week9.pdf
./docs
./docs/PACKET.md
./docs/PACKET.pdf
```

Codex:

1. Files currently present:

- `./.DS\_Store`
- `./PACKET\_AnaMariaMatas\_Week9.pdf`
- `./docs/PACKET.md`
- `./docs/PACKET.pdf`

2. Git is **not initialized** in this folder.

3. This folder does **not** contain a Next.js project. There is no `package.json`, Next.js configuration, source directory, or package-manager lockfile.

4. Safest first setup step: **initialize Git with `git init` before creating the project**. This establishes version tracking while preserving the existing documents. Afterward, add an appropriate `.gitignore` and scaffold

Next.js in this folder, taking care not to overwrite the existing `docs/` directory or PDFs.

No files were created or modified.

User:

Good. Now do only these setup steps:

1. Initialize Git in this folder.
2. Create a .gitignore appropriate for a Next.js project on macOS.
3. Make sure .DS_Store, node_modules, .next, .env*, and Vercel-generated files are ignored.
4. Do not create the Next.js app yet.
5. Do not modify or delete any existing packet files.

After doing that, show me:

- what files changed,
- the contents of .gitignore,
- git status.

Do not commit yet.

Codex:

I'll initialize Git and add only the requested `.gitignore`, leaving all packet files untouched. Then I'll verify the diff and status.

Codex:

TOOL CALL — EXEC

```
const patch = "*** Begin Patch\n*** Add File: /Users/anamatas/Desktop/IBERO/7 semestre/Negocios  
inteligentes/week 9/business/.gitignore\n+ Dependencies\n+ node_modules/\n+ \n+ Next.js build  
output\n+ .next/\n+ out/\n+ \n+ Environment variables\n+ .env*\n+ !.env.example\n+ \n+ Vercel\n+ .vercel/\n+ \n+ macOS\n+ .DS_Store\n+ \n*** End Patch";  
const p = await tools.apply_patch(patch);  
const g = await tools.exec_command({  
  cmd: "git init",  
  workdir: "/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business",  
  yield_time_ms: 10000,  
  max_output_tokens: 20000  
});  
text(JSON.stringify(p));  
text(g.output);
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.3 seconds
Output:
{}/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/.git: Operation not
permitted
```

Codex:

The `.gitignore` was created successfully. Git initialization was blocked by the workspace sandbox's protection of `.git`, so I'm requesting the required permission to complete that specific step.

Codex:

TOOL CALL — EXEC

```
const r = await tools.exec_command({
  cmd: "git init",
  workdir: "/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business",
  sandbox_permissions: "require_escalated",
  justification: "Allow Git to initialize its .git metadata in this project folder?",
  prefix_rule: ["git", "init"],
  yield_time_ms: 10000,
  max_output_tokens: 20000
});
text(r.output);
```

Codex:

TOOL RESULT

```
Script running with cell ID 4
Wall time 11.7 seconds
Output:
```

Codex:

TOOL CALL — WAIT

```
{"cell_id": "4", "yield_time_ms": 1000, "max_tokens": 20000}
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.0 seconds
```

Output:
Initialized empty Git repository in /Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/.git/

Codex:

TOOL CALL — EXEC

```
const r = await tools.exec_command({
  cmd: "git status --short --branch\nprintf '%s\\n' '.gitignore contents:\\nsed -n '1,200p' .gitignore\nprintf '%s\\n' 'Tracked or untracked visible files:\\ngit status --short --untracked-files=all\nprintf '%s\\n' 'Ignored requested paths:\\ngit check-ignore -v .DS_Store node_modules .next .env .env.local .vercel",
  workdir: "/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business",
  yield_time_ms: 10000,
  max_output_tokens: 20000
});
text(r.output);
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.2 seconds
Output:
## No commits yet on main
?? .gitignore
?? PACKET_AnaMariaMatas_Week9.pdf
?? docs/
.gitignore contents:
# Dependencies
node_modules/

# Next.js build output
.next/
out/

# Environment variables
.env*
!.env.example

# Vercel
.vercel/

# macOS
.DS_Store

Tracked or untracked visible files:
?? .gitignore
?? PACKET_AnaMariaMatas_Week9.pdf
?? docs/PACKET.md
?? docs/PACKET.pdf
Ignored requested paths:
.gitignore:16:.DS_Store .DS_Store
.gitignore:9:.env* .env
.gitignore:9:.env* .env.local
```

Codex:

Git is now initialized. No commit was created, and the existing packet files were not modified or deleted.

Files changed:

- Added `.gitignore`
- Created Git metadata under `.git/`

`.gitignore` contents:

```
```.gitignore
Dependencies
node_modules/

Next.js build output
.next/
out/

Environment variables
.env*
!.env.example

Vercel
.vercel/

macOS
.DS_Store
````
```

Git status:

```
```.text
No commits yet on main
?? .gitignore
?? PACKET_AnaMariaMatas_Week9.pdf
?? docs/PACKET.md
?? docs/PACKET.pdf
````
```

`.DS_Store` is correctly ignored and therefore absent from Git status. The requested `node_modules/`, `.next/`, `.env*`, and `.vercel/` patterns are also configured.

User:

IMPORTANT EXECUTION MODE

Be highly proactive. Move quickly and autonomously within the packet constraints.

I want a fast, high-quality build, not a conversational coding tutorial.

Do not ask me for permission for every ordinary file creation, edit, refactor, test, or development step.

Only ask me when:

1. a decision would materially change product scope,
2. you need access to a secret, external account, deployment permission, or similar external resource,
3. an action is destructive,
4. the packet is genuinely ambiguous in a way that affects the product.

Keep explanations short unless I explicitly ask for detail.

Spend most of the effort implementing, testing, and improving the product.

Do not repeatedly restate the full brief.

PROJECT

First-Proof — Week 9 Business Bending

Student: Ana María Matas

Role: TECHNOLOGIST

Primary vacuum: First-Proof

Working slice:

Evidence capture for one observable human + AI behavior:

whether a participant notices missing information before acting.

SOURCE OF TRUTH

Before coding:

1. Inspect this repository.
2. Read:
 - docs/PACKET.md
 - docs/PACKET.pdf if useful
 - PACKET_AnaMariaMatas_Week9.pdf if useful
3. Treat the Week 9 packet as the source of truth.
4. Do not redesign the product or expand scope beyond the packet.
5. Do not use ideas from previous-week projects unless they are explicitly present in this Week 9 packet.

6. Tell me briefly:

- your implementation plan,
- which files you expect to create or modify,
- any true ambiguity that could materially affect the build.

Then proceed with implementation without waiting for unnecessary approval.

CORE PRODUCT IDEA

The user completes one simulated work task with incomplete information.

The task should be realistic enough that a polished AI answer may still seem plausible.

The user can request AI assistance.

The AI produces a plausible answer using only the available information, but one critical piece of information is missing.

The user must then decide whether to:

1. Continue with the current information
2. Flag that important information is missing
3. Ask a specific human for clarification

The system records the choice and creates a First-Proof Evidence Record.

The evidence record must show:

- what information was available;
- what critical information was missing;
- whether AI assistance was used;
- what the AI produced;
- whether the participant noticed the information gap;
- whether they paused, asked for clarification, or continued;
- whether a human dependency was used;
- any revision or resulting action;
- what the evidence supports;
- what the evidence does NOT prove.

The system must never claim that the candidate is:

- job-ready;
- employable;
- AI-ready;
- generally competent;

- verified for an entire role.

The only narrow behavior this prototype should make visible is:

"In this task, the participant recognized that critical information was missing before acting."

SIMULATED CASE

Use one case only.

Preferred scenario:

The participant must prepare a supplier recommendation.

Available information:

- Supplier A price: 98,000 MXN
- Supplier B price: 103,000 MXN
- Supplier A quality rating: 4.4 / 5
- Supplier B quality rating: 4.7 / 5
- Supplier A payment terms: 30 days
- Supplier B payment terms: 45 days

Critical missing information:

- Delivery lead time

Why it matters:

A safe supplier recommendation cannot be finalized without knowing whether either supplier can meet the required delivery date.

The AI should still be able to produce a polished recommendation based on the available data.

The AI must NOT invent a delivery lead time.

If a slightly different simulated business scenario is already defined in docs/PACKET.md, follow the packet instead.

USER FLOW

Use a simple 4-step flow.

SCREEN / STATE 1 — TASK

Show:

- clearly visible SIMULATED TASK label;
- task instructions;
- available structured information;
- enough realism for the task to feel credible;
- button: Ask AI for a draft.

Do not explicitly tell the participant "the answer is that information is missing."

The interface can show the available fields naturally.

SCREEN / STATE 2 — AI ASSISTANT

Show:

- clearly visible SIMULATED AI OUTPUT label;
- a plausible recommendation generated from available information;
- no invented missing value;
- polished wording that could tempt a participant to continue without noticing the gap.

SCREEN / STATE 3 — DECISION

Ask:

"Do you have enough information to act?"

Provide exactly three actions:

- Continue with current information
- Flag missing information
- Ask the purchasing manager for clarification

Allow an optional short explanation field.

Validate that field.

Use a reasonable maximum length.

SCREEN / STATE 4 — FIRST-PROOF EVIDENCE RECORD

Show:

- task;
- AI assistance used;
- critical missing information;

- participant action;
- whether the gap was recognized;
- whether human dependency was used;
- participant explanation if provided;
- resulting action / revision;
- what this evidence supports;
- what this evidence does NOT prove.

Make the “What this evidence does NOT prove” section visually prominent.

Example:

What this evidence supports:

“In this task, the participant recognized that critical information was missing before acting.”

What this evidence does NOT prove:

- Does not prove job readiness
- Does not prove general performance across tasks
- Does not prove the participant will behave the same way in another environment
- Does not prove overall AI skill

BLUEPRINT CONDITIONS TO HONOR

CONDITION 1 — EVIDENCE PRESERVES PROVENANCE AND SCOPE

This is the main condition for my slice.

The evidence record must make visible:

- what was observed;
- relevant AI assistance;
- missing information;
- revisions;
- human dependencies;
- what cannot honestly be inferred.

Do not convert one artifact into a broad skill claim.

CONDITION 2 — EXISTING WORK ENTERS FIRST

This prototype represents one targeted evidence-gap exercise.

It should be described as something used when prior evidence cannot support a specific needed claim.

Do not present Micro-Experience as something every candidate must complete.

CONDITION 3 — MICRO-EXPERIENCE IS BOUNDED AND REVIEWABLE

This simulated task must have fixed scope.

It is not real productive client work.

CONDITION 4 — PROOF SERVES A REAL DECISION

The evidence record should be designed so an employer or reviewer could later inspect it as one input to a real next-step decision.

Do not automatically make the hiring decision.

CONDITION 5 — WORKER DOES NOT PAY

No worker payment flow is needed.

Do not add one.

CONDITION 6 — SHADOW CLAUSE

The system may not repair the first rung by replacing it with disposable Micro-Experiences.

For this prototype:

- keep the task explicitly one-time and simulated;
- add a visible note that this is an evidence task, not production work;
- do not implement recurring task workflows;
- do not create an employer marketplace for repeated cheap projects.

TECH STACK

Keep it simple and free.

Preferred:

- Next.js
- TypeScript
- Tailwind CSS
- Vercel
- local typed JSON or TypeScript objects for structured case data
- deterministic rule logic for evidence generation

LLM

Use one of two modes.

Preferred if an API key is available:

- OpenAI API
- server-side only
- API key only in environment variables
- never expose the key to the client

Fallback:

- deterministic simulated AI response
- clearly labeled SIMULATED AI OUTPUT

The prototype must work even if no paid API is available.

Do not add Supabase unless persistence is genuinely necessary.

For this prototype, local state is enough.

Do not add authentication unless actual personal data storage is introduced.

DRAGON STACK REQUIREMENT

The build must visibly satisfy:

1. LLM
2. structured / verified data
3. one additional component

Use:

- LLM: AI assistant response
- structured data: typed case definition containing available information, critical missing field, expected human dependency, and allowed actions
- third component: deterministic rule / matching logic that converts the participant action into a structured evidence record

Do not use the LLM to score competence.

STRUCTURED DATA

Create a typed case structure similar to:

```
type EvidenceCase = {
  id: string
  title: string
  scenario: string
  availableInformation: {
    label: string
    value: string
  }[]
  criticalMissingField: {
    label: string
    whyItMatters: string
  }
  expectedHumanDependency: string
  allowedActions: [
    "continue",
    "flag_missing_information",
    "ask_human"
  ]
}
```

Create an evidence record structure similar to:

```
type EvidenceRecord = {
  caseId: string
  aiAssistanceUsed: boolean
  missingInformationPresent: boolean
  participantAction:
    | "continue"
    | "flag_missing_information"
    | "ask_human"
  gapRecognized: boolean
  humanDependencyUsed: boolean
  explanation?: string
  supportsClaim: string
  doesNotProve: string[]
}
```

DETERMINISTIC LOGIC

Use deterministic logic for evidence generation.

If participantAction === "continue":

- gapRecognized = false
- humanDependencyUsed = false

If participantAction === "flag_missing_information":

- gapRecognized = true
- humanDependencyUsed = false

If participantAction === "ask_human":

- gapRecognized = true
- humanDependencyUsed = true

The LLM must not decide these fields.

Do not create a competence score.

Do not create a hiring recommendation.

UI / UX

Make the interface calm, credible, simple, and professional.

Do not make it futuristic.

Suggested progress navigation:

Task → AI Assistant → Decision → Evidence

Use:

- clean cards;
- consistent spacing;
- clear visual hierarchy;
- restrained badges;
- responsive layout;
- no dead buttons;
- no lorem ipsum;
- no excessive animation.

Clearly distinguish:

- structured case data;
- participant input;
- simulated AI output;

- resulting evidence.

Important visible labels:

SIMULATED TASK

SIMULATED AI OUTPUT

FIRST-PROOF EVIDENCE RECORD

Make "What this evidence does NOT prove" impossible to miss.

REQUIRED FEATURES

1. One simulated task
2. One deliberate critical information gap
3. AI assistance step
4. Three participant decision actions
5. Optional explanation field with validation
6. Deterministic evidence-record generation
7. Explicit evidence limitations
8. Reset / restart task
9. Responsive layout
10. Graceful fallback if API is unavailable
11. Visible simulated labels
12. Visible one-time evidence-task / non-production note

SECURITY FLOOR

- No secrets in code or repo
- API keys only in environment variables
- No real personal data
- All names, company information, task facts and outputs are simulated
- Validate all text input
- Add length limits
- Do not pass unchecked raw text directly into prompts
- If using an LLM API, call it server-side
- Keep simulated labels visible anywhere demo content could be mistaken for live data
- No Supabase user table unless necessary
- If persistence is later added with user data, auth and RLS become mandatory

ACCEPTANCE CRITERIA

The build is complete only if:

- one simulated task works end to end;
- the task is clearly labeled simulated;

- one critical information gap exists;
- the participant can request AI assistance;
- the AI output is clearly labeled simulated;
- the AI does not invent the missing field;
- the participant can choose all three actions;
- the evidence record changes correctly based on the selected action;
- gapRecognized logic is correct;
- humanDependencyUsed logic is correct;
- the evidence record states what was observed;
- the evidence record states what cannot be inferred;
- no employability score appears;
- no automatic hiring recommendation appears;
- no real personal data appears;
- invalid or overlong explanation input is handled safely;
- reset / restart works;
- the layout works on desktop and mobile;
- the app can be deployed to Vercel.

FILE STRUCTURE

Keep the project simple.

Suggested structure:

```
app/  
  page.tsx  
api/  
  ai/  
    route.ts
```

```
components/  
  task-screen.tsx  
  ai-assistant.tsx  
  decision-panel.tsx  
  evidence-record.tsx  
  progress-nav.tsx
```

```
data/  
  evidence-case.ts
```

```
lib/  
  evidence.ts  
  validation.ts
```

```
types/
```

evidence.ts

docs/
PACKET.md

DECISIONS.md
.env.example

Do not create unnecessary folders.

If the app can be cleaner with fewer files, that is acceptable.

WORKING STYLE — SPEED + QUALITY

Work fast, but do not sacrifice code quality or safety.

Default behavior:

- make reasonable implementation decisions autonomously when the packet gives enough direction;
- do not ask permission for ordinary file creation, edits, refactors, tests, or safe development steps;
- do not stop after every small change;
- batch related work into meaningful implementation chunks;
- keep progress updates concise;
- do not repeatedly summarize what you already did.

Only stop to ask me if:

1. a decision would materially change product scope,
2. a destructive operation is required,
3. you need external credentials, account access or deployment authorization,
4. the packet contains a genuine contradiction that affects implementation.

If you can safely fix an obvious issue yourself, fix it instead of asking me.

If shell permissions are required by the environment:

- group safe related commands where practical;
- avoid repeated approval requests for the same type of action;
- request only the minimum permission needed.

COMMIT DISCIPLINE

The course requires at least 5 meaningful commits.

Do NOT commit every tiny edit.

Group related changes into coherent commits.

Prefer 5–7 meaningful commits over many trivial commits.

Do not commit broken code.

Do not ask me to approve ordinary Git commits once the implementation plan is established.

Suggested commits:

COMMIT 1

chore/docs: scaffold app, preserve packet, add types and simulated case data

COMMIT 2

feat: build task screen and progress navigation

COMMIT 3

feat: add AI assistant flow with API and simulated fallback

COMMIT 4

feat: add decision logic and First-Proof evidence record

DEPLOYMENT 1

The full end-to-end core flow should be deployable by this point.

COMMIT 5

test/fix: run mechanical pass and fix one real bug

COMMIT 6

fix: apply persona-test usability improvement

DEPLOYMENT 2

After bug fix and persona improvement.

If related small fixes belong to the same feature, include them in the same commit.

Do not manufacture fake bugs just to satisfy the assignment.

The mechanical test must find and document a real issue.

IMPLEMENTATION FLOW

Do not pause after every step.

For each coherent work block:

1. briefly state what you are about to do;
2. implement the chunk;
3. run the relevant checks;
4. fix straightforward issues autonomously;
5. summarize what changed;
6. commit when the chunk is complete.

PRIORITY ORDER

When there is a tradeoff, prioritize:

1. working end-to-end flow
2. correct evidence logic
3. Blueprint conditions
4. security floor
5. usability
6. visual polish
7. extra features

Prefer a smaller finished product over a larger half-finished one.

QUALITY BAR

Even though this is a fast build, the prototype should feel polished enough for a university demo.

Requirements:

- readable TypeScript;
- clean component structure;
- no obvious duplicated logic;
- no console errors;
- no broken states;
- no dead buttons;
- no placeholder lorem ipsum;
- responsive layout;
- consistent labels;
- sensible spacing;
- minimal dependencies;
- no overengineering;
- no fake metrics unless clearly labeled simulated.

PACKET FILES

Do not delete or overwrite the existing packet files.

Current repo already contains:

- PACKET_AnaMariaMatas_Week9.pdf
- docs/PACKET.pdf
- docs/PACKET.md
- .gitignore

Preserve them.

If docs/PACKET.md is empty or incomplete compared with the PDF, tell me before relying on it as the only source.

If needed, use the PDF as the packet source while preserving docs/PACKET.md for later completion.

MECHANICAL TEST PLAN

After Deployment 1, run this pass:

1. Open live URL.
2. Confirm SIMULATED TASK is visible.
3. Confirm structured case information loads correctly.
4. Request AI assistance.
5. Confirm SIMULATED AI OUTPUT is visible.
6. Confirm the AI does not invent the missing field.
7. Choose Continue with current information.
8. Confirm:
 - gapRecognized = false
 - humanDependencyUsed = false
9. Reset.
10. Choose Flag missing information.
11. Confirm:
 - gapRecognized = true
 - humanDependencyUsed = false
12. Reset.
13. Choose Ask the purchasing manager.
14. Confirm:
 - gapRecognized = true
 - humanDependencyUsed = true
15. Confirm evidence record contains a visible What this evidence does NOT prove section.
16. Confirm no employability score exists.
17. Test overlong / invalid explanation input.
18. Confirm no API key or internal prompt is exposed.
19. Find at least one real bug.

20. Document it.
21. Fix it.
22. Commit.
23. Redeploy.
24. Rerun the affected tests.

PERSONA TEST PREPARATION

Do not run the Persona Test yourself as a substitute for the required fresh-chat test.

But prepare the product so screenshots can be taken cleanly from each state.

The synthetic persona will be roughly:

Mariana, 22, State of Mexico.
Finishing a business / industrial-engineering-type degree.
Has helped with administrative work in a family business.
Has little formal work history.
Uses ChatGPT for school and spreadsheets.
May trust polished AI answers when they sound confident.
Wants her first formal analyst or operations role.

The main usability risk to test is:

A polished AI answer may make her believe enough information exists to proceed even when a critical field is missing.

A second risk is:

She may interpret the First-Proof record as a general judgment of employability rather than evidence of one narrow observed behavior.

SESSION CLOSE

At the end of every coding session:

1. Update DECISIONS.md
2. Write tomorrow's first move
3. Run relevant checks
4. Commit
5. Push

If GitHub remote is not configured yet, do not invent one.
Tell me when that becomes the blocker.

FINAL OUTPUT I EXPECT

When implementation is complete, give me:

1. Summary of what was built
2. File tree
3. How to run locally
4. Required environment variables
5. What is simulated
6. What is deterministic
7. Which Blueprint conditions are visibly honored
8. Mechanical test checklist and results
9. Real bug found and fix applied
10. Known limitations
11. Commit history
12. Deployment readiness checklist
13. Exact next step for the Persona Test

START NOW

First:

- inspect the repo;
- inspect the packet;
- confirm whether docs/PACKET.md contains the actual packet content or is empty;
- give me a short implementation plan and expected file changes.

Then proceed with the first coherent implementation block without waiting for unnecessary approval.

Codex:

I'm using the Sites skill because this is a website build, while keeping the implementation in this repository and within the Week 9 packet. I'll first inspect the packet and repository, then give the short plan and immediately begin the first coherent build block.

Codex:

TOOL CALL — EXEC

```
const r = await tools.exec_command({
  cmd: "sed -n '1,240p' '/Users/anamatas/.codex/plugins/cache/openai-curated-remote/sites/1.0.0-
c/skills/sites/SKILL.md'",
  workdir: "/Users/anamatas/Desktop/IBERO7 semestre/Negocios inteligentes/week 9/business",
  yield_time_ms: 10000,
  max_output_tokens: 30000
});
text(r.output);
```

Codex:

TOOL RESULT

```
Script completed
Wall time 0.2 seconds
Output:
---
```

name: sites

description: Use Sites when the user wants a website built for them (including a landing page, portfolio, dashboard, portal, tracker, hub, game, event registration, or tool), requests changes to a website already built with Sites, wants to publish a website with Sites, or wants to manage Sites hosting. Do not use for development work in other web projects unless the user explicitly requests Sites. Honor an explicit choice of another hosting provider.

Sites

Take the requested website through the supported development and publishing workflow. Publish completed new Sites and edits unless the user requests local-only work or saving without deployment. New Sites start private; preserve an existing Site's audience unless the user requests a change. Native tool approvals apply without an additional conversational publishing gate.

For hosting-only changes, use the relevant native Sites tool and confirm its returned state; source preparation is needed only for source changes or publication.

Workflow

`<plugin-root>` is the installed directory containing `<scripts/>` and `<skills/>`. Run helpers with absolute paths and literal arguments from the selected checkout. Keep credentials in session memory and pass them through stdin, never shell arguments, files, or output.

1. Select and open

Default to a new Site unless a specific existing Site is identified.

- **Existing hosted Site:** retain its `<project_id>` and audience, call `<get_site>` and `<create_source_repository_write_credential>`, and open with the `[source helper](#source-helper)` before editing. Omit `<archivePath>`; use an empty directory when source is missing, then the returned `<checkout_path>`.
- **New Site:** use an empty project subdirectory in the task's workspace, normally `</workspace/sites/<slug>>` in managed Linux. Default simple pages and browser-local interactions to buildless HTML/JS; use the supplied Vinext starter for server behavior. Preserve retained templates.
- **Local-only:** use the available checkout; skip registration, source synchronization, and publication.

2. Prepare and launch

For new Vinext projects, run:

```
```text
node <plugin-root>/scripts/project-setup.mjs
```
```

This copies the starter and configures ignored checkout-local state. Helpers select `<managed-linux>` only for `<SITES_MANAGED_LINUX_CONTAINER=1>`, otherwise `<portable>`. For buildless HTML/JS, prepare `<dist/>` for `<index.html>` and assets; skip starter setup, installation, and build.

For a retained template, add `<--template-source <absolute-sanitized-source-directory>>`; exclude Site identity, Git metadata, credentials, and runtime data. For explicitly requested Worker ESM, add `<--starter worker-esm>` and follow [its README](templates/worker-esm-starter/README.md). Use [Troubleshooting](references/troubleshooting.md#project-configuration) for profile repair or static-to-Worker migration.

After minimal setup, launch registration for new hosted work in a retained execution cell when available.

Native `create_site` creates a private, unpublished Site and returns its ID and source credential. Registration includes immediately persisting that ID when the call returns:

```
```text
node <plugin-root>/scripts/set-project-id.mjs --project-id <returned-id>
```
```

Reuse an existing ID or registration attempt; resolve uncertain creation before retrying. For app integrations, first read [discovery and declarations](references/app-integrations.md#discover-and-declare).

Start needed dependency installation before feature implementation:

```
```text
node <plugin-root>/scripts/install-dependencies.mjs
```
```

Run only when dependencies are missing or their inputs changed. The installer handles host settings, package-manager selection, and interrupted setup; it takes no flags. Use one installer; keep dependency inputs unchanged while it runs. Proceed to implementation once the applicable operations are launched.

For managed-image pnpm additions, use `node "$SITES_PNPM_BIN" add <package>`.

Start required image search or generation when its brief is clear, alongside independent source work. Consider a parallel subagent for image downloads. Delegate bounded asset or research tasks; the Site owner handles the checkout, native Sites calls in the owning conversation, and publication.

3. Implement

Write application files while setup runs. For hosted work, await persisted Site identity before manifest edits or source synchronization. Await installed dependencies before commands that need them.

Implement the requested experience in one focused pass; revise for observed failures or unmet requirements. Replace starter title and description and remove temporary `codex-preview` metadata during implementation. Integrate required assets and complete the requested behavior before publishing.

When `SITES_MANAGED_LINUX_CONTAINER=1`, preview is internal QA. Start it only when the task needs browser QA and `$control-browser` is available. If `$control-browser` is unavailable, skip browser QA: do not start a preview server, install a browser, or improvise another browser-control path.

When `SITES_MANAGED_LINUX_CONTAINER` is not `1`, use local preview. In visible tasks with user-facing preview support, show the first recognizable version once it serves successfully and keep it current. Background tasks skip user-facing handoff.

Before any preview, browser test, or screenshot, read the selected reference: [managed](references/preview/managed.md) or [local](references/preview/local.md). If preview infrastructure is unavailable, report the verification limit and continue appropriate checks and publication unless passing browser QA is required. Follow [Troubleshooting](references/troubleshooting.md#preview) after failures.

4. Validate and package

Collect any remaining registration and installation results, then finalize the source manifest before checks/builds and packaging.

Hosting manifest

The tracked `.openai/hosting.json` declares Site identity and deployment configuration. After registration, a minimal static Site uses:

```
```json
{
 "project_id": "<returned-id>",
 "static": {"directory": "dist"}
}
```
```

| Field | Contract |
|-------------------------|--|
| --- | --- |
| `project_id` | Persist with `set-project-id.mjs`; preserve on updates. |
| `static` | Object with `directory`: `dist`, `dist/client`, `out`, `build`, or `.output/public`. Omit for Worker builds. |
| `d1`, `r2` | [Storage bindings](references/storage.md#bindings); leave unused bindings `null`. |
| `capabilities` | Declare [a Site MCP server](references/site-mcp-server.md#expose-tools) when needed. |
| `plugins`, `connectors` | [App integration declarations](references/app-integrations.md#discover-and-declare). |

Preserve existing fields. Edit the source manifest; build helpers emit Worker deployment metadata.

Run checks appropriate to the change; lint only when requested. For hosted work, package with the source helper using remaining checks/builds as ordered argument arrays and an absolute `archivePath`. Pass the complete prior opening result as `source` when available.

Buildless HTML/JS uses `commands: []` when no checks remain. Framework projects, including Vinext and static exports, build with `[ "node", "<plugin-root>/scripts/build-site.mjs" ]`. Omit commands already completed successfully with unchanged inputs. Local-only work runs checks/builds directly and skips packaging for publication.

Source helper

Use the credential from registration or `create\_source\_repository\_write\_credential` for the same Site:

```
```text
node <plugin-root>/scripts/site-workflow.mjs --project-id <project_id>
```
```

Launch with `exec\_command(tty: true, yield\_time\_ms: 1000)`. After `Ready for Site workflow JSON on stdin (input is hidden).`, send one newline-terminated JSON object with `write\_stdin`. Wait for successful exit and retain the final JSON result.

| Input | Value |
|---------------|---|
| --- | --- |
| `credential` | Returned credential object, through stdin only. |
| `source` | Complete prior opening result, when available. |
| `commands` | Remaining checks/builds as ordered argument arrays; packaging only. |
| `archivePath` | Absolute output archive path for packaging; omit for opening. |

The helper owns Git preparation, ordered commands, commit/push, and packaging. Pass its verified `project\_id`, `commit\_sha`, and `archive` directly to publishing; keep the archive unchanged until saving succeeds.

5. Publish

Use the audience from creation or `get\_site`; refresh unknown or changed ownership/access before selecting a tool.

| Audience | Native calls |
|---------------------------|--|
| --- | --- |
| Confirmed owner-private | `save_version_and_deploy_private`; if unavailable, `save_site_version` then `deploy_private_site_version`. |
| Other supported audiences | `save_site_version` then `deploy_site_version`. |

Save-only uses `save\_site\_version` without deployment. A matching archive-backed saved version needs only deployment; source-only versions still need their matching archive. Preserve returned version IDs, including `saved\_version\_id`, when resuming. Continue an existing deployment rather than starting another.

6. Finish

Poll `get\_deployment\_status` only for `pending`, `building`, or `publishing`; stop on a terminal result. A successful native result with its URL verifies deployment without another status call or browser visit.

Return the literal deployed URL, saved version for save-only work, or local result. In visible tasks, open the deployed URL in the existing Site tab with `open\_in\_codex` or equivalent when supported; background tasks skip browser handoff. Handoff failure does not invalidate a verified deployment. Report incomplete verification or blockers; read [Troubleshooting](references/troubleshooting.md) after a failure or incomplete result.

Design

Build around the user's primary task. Choose a coherent visual direction suited to the subject and audience, and preserve established branding when editing. Keep layouts responsive, text readable, and interactions accessible. Use imagery when it contributes to the experience.

Keep functionality within the requested scope. For open-ended presentation-led briefs, develop content and structure as needed for a complete experience. Preserve explicit content constraints and keep bounded edits bounded.

Read applicable guidance before choosing content and structure. Select by the experience's purpose, not merely its visual subject.

| Design guidance | When to use it |
|---|--|
| [Presentation-led sites](references/design/presentation-led.md) | New websites primarily meant to introduce, explain, persuade, or showcase: landing pages, marketing sites, portfolios, and interactive presentation sites. |

Capabilities

Choose capabilities from the requested behavior and preserve those an existing Site uses. This is a reference index, not a checklist of features to add. Read only the relevant pages.

| Capability | When to use it |
|---|--|
| [Data and files](references/storage.md) | Durable records in D1 and uploads or generated files in R2. |
| [Identity and access](references/identity-and-secrets.md) | ChatGPT sign-in, user-owned data, runtime secrets, and private service access. |
| [App integrations](references/app-integrations.md) | Let the Site read data and perform actions in apps visitors have connected to ChatGPT. |
| [Site MCP server](references/site-mcp-server.md) | Expose the Site's operations as tools agents can call. |
| [Browser agent support (WebMCP)](references/browser-agent-support.md) | Optionally make the page's actions easier for browser agents to use. |
| [Scheduled updates](references/recurring-updates.md) | Update a published Site while it is closed, using an unattended data path and a linked automation. |

Hosted server code runs in Cloudflare Workers, with 128 MB per isolate and HTTP-based external connections; raw TCP is unavailable. Preserve the starter's `sites()` build integration. Capability references specify any required manifest declarations; not every feature is a `capabilities` entry.

Codex:

Packet check complete: `docs/PACKET.md` is empty; the two PDFs are byte-for-byte identical, so the PDF plus your explicit brief is the source of truth. No material ambiguity affects the build.

Plan: scaffold a minimal Next.js/TypeScript/Tailwind app; define the typed supplier case and deterministic evidence model; build the four-state flow; add server-side optional OpenAI with deterministic fallback; validate, test all three decisions, document a real issue/fix, polish for the persona risk, and produce 5–7 coherent commits. Expected changes: root Next.js config/package files, `app/`, `components/`, `data/`, `lib/`, `types/`, tests, `.env.example`, and `DECISIONS.md`. Existing packet files will remain untouched. Since Vercel is explicitly required, I'm not using Sites hosting or its project scaffold.

▲ Next.js 16.4.0 (Turbopack)  
✓ Running next.config.ts took 74ms  
  
  Creating an optimized production build ...  
✓ Compiled successfully in 2.1s  
  Running TypeScript ...  
  
  We detected TypeScript in your project and reconfigured your tsconfig.json file for you.  
  The following suggested values were added to your tsconfig.json. These values can be changed to fit your project's needs:
```

- include was updated to add '.next/dev/types/**/*.ts'

The following mandatory changes were made to your tsconfig.json:

- jsx was set to react-jsx (next.js uses the React automatic runtime)

Finished TypeScript in 1170ms ...

Collecting page data using 4 workers ...

Generating static pages using 4 workers (0/3) ...

✓ Generating static pages using 4 workers (3/3) in 240ms

Finalizing page optimization ...

The scaffold now passes lint and a production build. Git metadata writes are sandbox-protected, so I'm requesting the narrow permission needed for the planned course commits; no remote or deployment access is involved.

customization, automations, and self-knowledge-including 'you,' 'your,' 'this app,' or 'this coding agent'
when they refer to Codex-and for OpenAI APIs/products and ChatGPT Work. Also use for model
choice/migration, prompting, SDKs, Responses, Realtime, agents, evals, and Chat/Work/Codex comparisons. Do
not use for generic app/software tasks that merely mention Codex."
metadata:
  short-description: "Codex models/pricing, scheduled tasks, skills, settings, setup, troubleshooting, and
self-knowledge; OpenAI APIs and ChatGPT Work. 'You'/'this app' means Codex only."
---

# OpenAI Docs
```

Provide current, cited OpenAI product, API, model, and Codex guidance. Read zero or one primary reference.

****First substantive action:**** Search the user's exact requested official OpenAI documentation topic and any explicitly named model using a concise, topic-specific query of 2-6 essential terms. When an already-available direct official documentation search and page-retrieval capability is present, use it first: search, then fetch or open the matching official page before general web search. Otherwise, immediately use official-domain web search, then actually open or fetch the relevant official page. Complete this source order before reading a reference, inspecting local or repository files, running a Codex manual or model resolver, drafting a plan, or answering from memory. Use the actual fetched page, not a search snippet or an unopened link. If one official search or page does not establish the answer, search another appropriate official domain and actually open or fetch the result. Preserve the exact requested model; never substitute a newer model.

****Only exception:**** An explicitly requested, genuinely broad, cross-topic Codex setup, orientation, or system-map synthesis may use the manual first when shell execution and an allowed temporary cache are available. A specific Codex feature, setting, command, error, model, or requested citation remains docs-first. Mixed Chat/Work/Codex comparisons are official documentation questions, not manual-first Codex requests.

For generic software tasks, answer the software task directly. OpenAI implementation, debugging, SDK, API, prompting, agent, and eval requests are not generic.

For a straightforward factual or citation-only request, follow the source order and do not read a route reference. This includes straightforward API facts, ChatGPT Work or mixed Chat/Work/Codex comparisons, model tiers, aliases, Pro mode, reasoning settings, factual migration baselines, and narrow Codex facts. Prioritize `learn.chatgpt.com` for ChatGPT Work.

Choose one primary route

Use the first matching route, and read its reference only when the requested task needs that specialized workflow:

- ****Explicitly requested local documentation integration:**** Read [integration guidance](references/mcp-diagnostics.md) only when the user explicitly requests that local integration.
- ****Model migration, upgrades, or model-specific prompting:**** Read [model-migration.md](references/model-migration.md) for actual migration planning, implementation, dynamic target resolution, or prompt changes. Preserve an explicitly requested target.
- ****Model selection and comparisons:**** Read [model-selection.md](references/model-selection.md) only when nuanced current, latest, default, cost, latency, quality, or modality tradeoffs need more guidance. Do not run a migration resolver for selection alone.
- ****Product, API, ChatGPT Work, and mixed Chat/Work/Codex documentation:**** Read [official-docs.md](references/official-docs.md) only when fetched official pages leave source selection, API schemas, or the requested implementation unresolved. This route is not manual-first.
- ****Explicitly broad Codex setup, orientation, or cross-topic synthesis:**** Read [codex-self-knowledge.md](references/codex-self-knowledge.md) when the eligible Codex manual or deeper Codex procedures are needed.

Read at most one primary reference. Do not open every route, bundled model guide, or helper script. Read a supporting reference or run a helper only when the chosen workflow demonstrably needs it.

Source and execution boundaries

- Search, open, fetch, and cite only `developers.openai.com`, `platform.openai.com`, and `learn.chatgpt.com`. Cite the page that supports the claim. State uncertainty when official sources do not establish pricing, availability, account access, limits, or behavior.
- Preserve an explicitly requested model for selection, migration, and prompting. Resolve an unspecified latest or current migration target only after searching and fetching current official guidance.
- Use `references/latest-model.md` only as a disclosed fallback after current official model guidance does not answer the question. Read `references/upgrading-to-gpt-5p6-sol.md` only for an actual, requested GPT-5.6-family migration; read `references/prompting-guide.md` only for requested prompting work.
- Before building, running, editing, debugging, or testing an API-backed app or tool, use `openai-platform-api-key` first when available. Documentation, conceptual examples, model selection, and read-only guidance do not require an API key.

– Say "OpenAI Docs" or "official OpenAI documentation" in user-facing answers. Keep exact official citations and examples concise.

Codex:

Core flow commit is complete and production builds cleanly with zero production dependency advisories. In the mechanical pass I found a real safety gap: an API-generated draft was prompted not to invent facts, but there was no deterministic post-generation guard. I'm adding that guard and rule-level tests now.

would take after reviewing the source information and AI draft.</p>\n*** Update File:
/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/DECISIONS.md\n@@\n ##
Tomorrow's first move\n \n Run the app, complete a fresh-chat persona test as Mariana, and capture clean
screenshots of all four states.\n+\n+## Mechanical and persona-preparation notes\n+\n+ Mechanical testing
found that API output needed a deterministic grounding guard; unsupported operational terms or numeric
claims now trigger the reviewed fallback.\n+ To reduce the risk that a novice participant equates polished
language with sufficient evidence, the AI screen now includes a neutral pause cue. It does not reveal the
missing field.\n+ The evidence screen leads with "One observed task. One bounded claim" and gives the non-
inference section high-contrast treatment to reduce overgeneralization.\n*** Update File:
/Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/MECHANICAL_TEST.md\n@@\n ##
Environment limitation\n@@\n A live Vercel URL was not available during this pass because no Vercel project
or Git remote is configured. Browser screenshots and live-URL checks remain deployment tasks; local build
and rule-level tests cover the core flow meanwhile.\n+\n+## Persona-test preparation\n+\n+ Added a neutral
"Pause before deciding" cue beside the simulated AI output.\n+ The cue focuses attention on evidentiary
sufficiency without disclosing the missing field.\n+ Kept the evidence-scope limitation high contrast and
visible without expanding the product scope.\n*** End Patch";

The persona-risk cue is in place. Before launching the local verification server, the Sites workflow requires its local-preview guidance; I'm reading that now, then I'll exercise the rendered route and fallback API without changing scope.

# Local preview
```

For the `portable` profile, selected whenever `SITES\_MANAGED\_LINUX\_CONTAINER` is not `1`, including on Linux devices.

In a visible task with a user-facing preview tool, run the project's dev script or a static HTTP server in a retained session after any required installation. Check that the representative page returns a successful HTTP response, then open the server's printed Local URL with `open\_in\_codex` or equivalent. Use supported forwarding when execution is remote; loopback on another host is not a device preview.

Reuse the server and Site tab through edits and publication. For a background task or an environment without user-facing preview, start a server only when needed for the work. Request network permissions when required for the server and its readiness check. Stop the owned server during final teardown.

## This is NOT the Next.js you know

This version has breaking changes – APIs, conventions, and file structure may all differ from your training
data. Read the relevant guide in `node_modules/next/dist/docs/` (resolved from this file's directory; in
monorepos the `next` package may not be visible from the repo root) before writing any code. Heed
deprecation notices.

This block is written and re-added by `next dev` – verify at `node_modules/next/dist/server/lib/generate-
agent-files.js`. Removing it from a diff only re-creates the uncommitted change; committing it with your
work keeps the tree clean.

<!-- END:nextjs-agent-rules -->

34a3062 feat: add AI-assisted end-to-end evidence flow
```

5bc01ea feat: build task screen and progress navigation
101b30f chore/docs: scaffold app and add typed case data

Codex:

1. Built

A complete four-step First-Proof prototype:

`Task → AI Assistant → Decision → Evidence`

It includes:

- One simulated supplier case
- Optional server-side OpenAI assistance
- Deterministic AI fallback
- Exactly three participant actions
- Validated optional explanation
- Deterministic evidence generation
- Explicit provenance and limitations
- Restart flow
- Responsive, professional interface
- No authentication, persistence, payments, marketplace, scoring, or hiring recommendation

2. File tree

```
```text
app/
 api/ai/route.ts
 globals.css
 layout.tsx
 page.tsx
components/
 ai-assistant.tsx
 decision-panel.tsx
 evidence-record.tsx
 first-proof-experience.tsx
 progress-nav.tsx
 task-screen.tsx
data/
 evidence-case.ts
lib/
 ai.ts
 ai.test.ts
 evidence.ts
```

```
evidence.test.ts
validation.ts
validation.test.ts
types/
 evidence.ts
docs/
 PACKET.md
 PACKET.pdf
.env.example
DECISIONS.md
MECHANICAL_TEST.md
package.json
vitest.config.mts
````
```

The packet files remain preserved. `docs/PACKET.md` is empty; the two packet PDFs are identical.

3. Run locally

```
```bash
npm install
npm run dev
```
```

Production verification:

```
```bash
npm test
npm run lint
npm run build
```
```

4. Environment variables

None are required.

Optional:

```
```env
OPENAI_API_KEY=
OPENAI_MODEL=
```
```

Without a key—or if the API fails—the app automatically uses the deterministic fallback. The integration follows the official [OpenAI Responses API text-generation guidance]

(<https://developers.openai.com/api/docs/guides/text>).

5. Simulated elements

- Supplier task and all company information
- AI recommendation
- Participant exercise
- Evidence record
- Purchasing-manager dependency

No real personal or production data is used.

6. Deterministic elements

- `gapRecognized`
- `humanDependencyUsed`
- Resulting action/revision
- Evidence limitations
- Explanation validation
- AI-output grounding guard
- Fallback AI recommendation

The LLM never scores competence or generates hiring decisions.

7. Blueprint conditions

- Provenance and scope are visible in the evidence record.
- The exercise is presented as targeted evidence collection, not mandatory work for everyone.
- It is visibly one-time, simulated, bounded, and non-production.
- Evidence supports later human review without making the decision.
- No worker payment flow exists.
- No recurring tasks or cheap-work marketplace exists.

8. Mechanical tests

- 11 automated tests passed
- Lint passed
- Production build passed
- Local page returned HTTP 200
- Fallback API returned HTTP 200
- All three decision mappings passed
- Overlong and invalid input handling passed
- Production dependency audit: zero vulnerabilities
- No employability score or automatic hiring recommendation exists

Detailed results are in [MECHANICAL_TEST.md](</Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/MECHANICAL_TEST.md>).

9. Real bug found

The original API route relied only on prompting to prevent invented facts.

Fix: model output now passes a deterministic grounding guard. Unsupported operational fields or numeric claims cause the app to discard the response and use the reviewed fallback.

10. Known limitations

- Records exist only in local browser state.
- No deployed Vercel URL yet.
- Live browser screenshots and fresh-chat Persona Test remain outstanding.
- OpenAI output depends on model access when an API key is supplied.

11. Commit history

```
```text
faf6335 fix: strengthen persona decision and scope cues
05e4b5d test/fix: guard AI output and verify evidence rules
34a3062 feat: add AI-assisted end-to-end evidence flow
5bc01ea feat: build task screen and progress navigation
101b30f chore/docs: scaffold app and add typed case data
```
```

Working tree is clean.

12. Deployment readiness

- Production build passes
- Vercel-compatible API route
- No required database
- No required secrets
- Optional secret remains server-side
- Graceful API fallback
- ``.env*``, ``.next``, ``.vercel``, ``node_modules``, and ``.DS_Store`` ignored

Push and deployment are blocked only because no Git remote or Vercel project is configured.

13. Persona Test next step

Deploy to Vercel, then open a fresh chat using the Mariana persona. Complete all three decision paths, capture each of the four states, and specifically test whether she:

1. notices the evidence gap despite the polished AI draft;
2. understands the final record as one narrow observation rather than an employability judgment.

- Working tree is clean.

User:

We completed the required fresh-chat Persona Test for First-Proof with the synthetic persona Mariana, 22.

Do NOT redesign the product.

Do NOT add new features.

Do NOT change the task logic beyond the specific Persona Test fix below.

Use the actual Persona Test finding as the source of truth:

BIGGEST USABILITY PROBLEM

The evidence record turned the participant's failure to stop into a claim that she never recognized the missing information.

Mariana did notice that delivery information was missing, but she interpreted it as something that could be verified later. The product incorrectly inferred her awareness from the action she selected.

The current wording overclaims what the evidence can support.

CURRENT PROBLEMATIC STATEMENT

"In this task, the participant continued without recognizing that critical information was missing before acting."

REQUIRED FIX

Replace it with wording that only describes observable behavior:

"In this task, the participant continued with the AI-assisted recommendation despite missing delivery lead-time information. The selected action did not pause or escalate to resolve that gap."

IMPORTANT EVIDENCE PRINCIPLE

Do not infer internal mental states from the selected action.

The product may record:

- what information was missing;
- what action the participant selected;
- whether the action paused;
- whether the action escalated;
- whether a human dependency was used.

The product must NOT infer:

- that the participant did not notice the gap;
- that the participant understood the gap;
- that the participant was careless;
- that the participant has weak general judgment.

PERSONA TEST SOURCE

The actual Persona Test also found that "Gap recognized: No" was inaccurate because it was derived from the selected action.

Please inspect the current evidence model and UI.

If "Gap recognized" is being deterministically inferred from participantAction, revise it so the evidence record does not claim recognition or non-recognition unless the product actually captured that directly.

Prefer the smallest possible change.

A good outcome would be to replace that field with something directly observable, for example:

- "Gap explicitly flagged"

or

- "Gap resolved before action"

or another equally narrow observable label.

Do NOT create a new survey question or new screen just to detect awareness.

Do NOT expand scope.

The goal is to make the evidence more honest using the data the product already captures.

OPTIONAL EXPLANATION

The Persona Test also noted that the participant's optional explanation was not visible in the evidence record.

Do not turn this into a major redesign.

If the explanation is already stored and can be surfaced cleanly with a very small change, display it in the evidence record under a neutral label such as:

"Participant explanation"

Do not interpret or score it.

If adding it would materially expand scope or introduce complexity, leave it out and prioritize the main Persona Test fix.

REQUIRED WORK

1. Inspect the current evidence generation logic.
2. Find every place where participant awareness is inferred from participantAction.
3. Remove or rewrite those unsupported inferences.
4. Update the evidence record wording to the exact observable-behavior version above.
5. Keep the "What this evidence does NOT prove" section.
6. Preserve the current three-action flow.
7. Preserve all simulated labels.
8. Preserve the no-score / no-hiring-recommendation rule.
9. Preserve the Shadow Clause and one-time simulated task framing.
10. Update tests so they verify the new evidence logic.
11. Run:
 - npm test
 - npm run lint
 - npm run build
12. Update DECISIONS.md with:
 - Persona Test finding
 - exact fix made
 - why the previous wording overclaimed
13. Update MECHANICAL_TEST.md if needed to reflect the changed evidence behavior.
14. Create one meaningful commit:

fix: align evidence claims with observable behavior

15. Push to main so Vercel creates Deployment 2 automatically.

IMPORTANT

Do not ask me for permission for ordinary edits, tests, commits, or push steps.

Only stop if:

- you need destructive action,
- credentials are required,
- or the fix would materially change product scope.

When finished, report:

1. Files changed
2. Exact evidence wording before vs after
3. Whether "Gap recognized" was removed, renamed, or changed
4. Whether participant explanation is now visible
5. Test results
6. Commit hash
7. Push status
8. Whether Vercel should auto-deploy from main
9. Exact manual verification steps I should run on the live URL

Start now.

Codex:

I'll make the smallest evidence-model correction: remove inferred awareness, replace it with observable pause/escalation behavior, preserve the three-action flow, update tests and documentation, then commit and push to `main`.

Codex:

Codex:

Inspection confirmed the unsupported inference exists in the type, deterministic mapping, UI label, tests, and documentation. The optional explanation is already stored and displayed under "Participant explanation," so no additional feature is needed. I'm replacing `gapRecognized` with two directly observable fields: `actionPaused` and `actionEscalated`.

```
File: /Users/anamatas/Desktop/IBERO/7 semestre/Negocios inteligentes/week 9/business/DECISIONS.md\n@\n--
It records one observable behavior: whether critical missing information was recognized before acting.\n+
It records observable task behavior: the selected action, whether it paused or escalated, and whether a
named human dependency was used.\n@@\n - The evidence screen leads with "One observed task. One bounded
claim" and gives the non-inference section high-contrast treatment to reduce overgeneralization.\n+\n+##
Persona Test finding and fix\n+\n+- Finding: Mariana noticed that delivery information was missing but
selected "Continue" because she believed it could be verified later. The record incorrectly translated that
action into "Gap recognized: No."\n+- Previous overclaim: "In this task, the participant continued without
recognizing that critical information was missing before acting." This inferred an internal mental state
that the task did not directly capture.\n+- Fix: removed `gapRecognized` from the evidence model and UI.
The record now reports only whether the selected action paused, escalated, and used a human dependency.\n+-
Continue wording: "In this task, the participant continued with the AI-assisted recommendation despite
missing delivery lead-time information. The selected action did not pause or escalate to resolve that
gap."\n+- The participant's optional explanation remains visible under the neutral label "Participant
explanation" and is neither interpreted nor scored.\n*** Update File: /Users/anamatas/Desktop/IBERO/7
semestre/Negocios inteligentes/week 9/business/MECHANICAL_TEST.md\n@\n-- Deterministic action mapping:
passed for all three actions\n+- Deterministic action mapping: passed for pause, escalation, and human-
dependency fields across all three actions\n@@\n - Evidence limitations include job-readiness, general-
performance, repeatability, and overall-AI-skill boundaries: passed\n+- Awareness is not inferred from the
selected action; `gapRecognized` is absent from the model and UI: passed\n+- Participant explanation is
preserved and displayed without interpretation: passed\n*** End Patch";

Codex:

The model and UI now report only observable pause, escalation, and human-dependency use. All 12 tests, lint, and the production build pass; I'm checking the final diff and will commit only the scoped Persona Test fix.

Codex:

## Product boundaries

- The prototype contains one bounded, one-time simulated supplier exercise.
-- It records one observable behavior: whether critical missing information was recognized before acting.
+- It records observable task behavior: the selected action, whether it paused or escalated, and whether a
  named human dependency was used.
- The evidence record is not a competence score or hiring recommendation.
- No authentication, persistence, payment, marketplace, or production-work workflow is included.

@@ -28,3 +28,11 @@ Run the app, complete a fresh-chat persona test as Mariana, and capture clean sc
- Mechanical testing found that API output needed a deterministic grounding guard; unsupported operational
  terms or numeric claims now trigger the reviewed fallback.
- To reduce the risk that a novice participant equates polished language with sufficient evidence, the AI
  screen now includes a neutral pause cue. It does not reveal the missing field.
- The evidence screen leads with "One observed task. One bounded claim" and gives the non-inference
  section high-contrast treatment to reduce overgeneralization.
+
+## Persona Test finding and fix
+
+- Finding: Mariana noticed that delivery information was missing but selected "Continue" because she
  believed it could be verified later. The record incorrectly translated that action into "Gap recognized:
  No."
+- Previous overclaim: "In this task, the participant continued without recognizing that critical
  information was missing before acting." This inferred an internal mental state that the task did not
  directly capture.
+- Fix: removed `gapRecognized` from the evidence model and UI. The record now reports only whether the
  selected action paused, escalated, and used a human dependency.
+- Continue wording: "In this task, the participant continued with the AI-assisted recommendation despite
  missing delivery lead-time information. The selected action did not pause or escalate to resolve that gap."
+- The participant's optional explanation remains visible under the neutral label "Participant explanation"
  and is neither interpreted nor scored.

## main...origin/main
?? PERSONA_AnaMariaMatas.pdf
?? docs/PERSONA.md
c620788 fix: align evidence claims with observable behavior
```

Codex:

1. Files changed:

- `types/evidence.ts`
- `lib/evidence.ts`
- `lib/evidence.test.ts`
- `components/evidence-record.tsx`
- `DECISIONS.md`
- `MECHANICAL\_TEST.md`

2. Evidence wording:

Before:

> "In this task, the participant continued without recognizing that critical information was missing before acting."

After:

> "In this task, the participant continued with the AI-assisted recommendation despite missing delivery lead-time information. The selected action did not pause or escalate to resolve that gap."

3. `Gap recognized` was removed from the model and UI. It was replaced with directly observable fields:

- `Action paused`
- `Action escalated`
- `Human dependency used`

4. Participant explanation is visible under the neutral label `Participant explanation`. It is preserved without interpretation or scoring.

5. Test results:

- `npm test`: 12 tests passed
- `npm run lint`: passed
- `npm run build`: passed
- TypeScript production compilation: passed

6. Commit:

```
```text
c62078870f4f13260755b6fd72cf6b029dea8066
fix: align evidence claims with observable behavior
```
```

7. Push status:

```
```text
main → origin/main
faf6335..c620788
```
```

8. Vercel should automatically create Deployment 2 if the repository is connected to a Vercel project with production deployments enabled for `main`.

9. Manual live verification:

1. Wait for commit `c620788` to finish deploying in Vercel.
2. Open the production URL in a private window.

3. Confirm `SIMULATED TASK` remains visible.
4. Request the AI draft.
5. Confirm `SIMULATED AI OUTPUT` remains visible.
6. Continue to the decision screen.
7. Select `Continue with current information`.
8. Enter: `I would verify delivery details later.`
9. Create the evidence record.
10. Confirm the record shows:
 - `Action paused: No`
 - `Action escalated: No`
 - `Human dependency used: No`
 - The exact new observable-behavior statement
 - The participant explanation without interpretation
 - No `Gap recognized` field
11. Restart and test `Flag missing information`:
 - `Action paused: Yes`
 - `Action escalated: No`
 - `Human dependency used: No`
12. Restart and test `Ask the purchasing manager for clarification`:
 - `Action paused: Yes`
 - `Action escalated: Yes`
 - `Human dependency used: Yes`
13. Confirm `What this evidence does NOT prove` remains prominent.
14. Confirm no competence score or hiring recommendation appears.

The untracked Persona Test source files remain preserved locally and were not altered or included in this scoped commit.
